1. Equipment Introduction

This chapter mainly introduces functions and structures of DWG2000D-32G.

1.1 Introduction

DWG2000D-32G is full functions VoIP gateway based on IP and GSM network, which provides a flexible network configuration, powerful features, and good voice quality. It works for carrier grade, enterprise, residential users for cost-effective solution.

1.2 Applications Scenario

DWG2000D-32G implements smooth transition between PLMN (GSM) and VoIP network.

With the development of users and telecom service, mobile network and fixed network integration will be steadily increasing. DWG2000D-32G provides high quality VoIP service which perfectly meets the requirement. A typical application scenario shown as figure 1-2-1

Figure 1-2-1 application scenario

1.3 Product Appearance

The appearance of DWG2000D-32G shows as follow

Figure 1-3-1 Front view of DWG2000D-32G

Table 1-3-1 Description of Front view

Index	Sign	Description
1	ANT Interface	Standard antenna interface
2	ANT indicator	Indicator of SIM card, status: register, unregister
3	LAN	10/100M Base-TX, RJ-45
4	Console	Serial port, it is a serial communication physical interface with RS232
5	RST	Keep press for 7 seconds to restore the factory setting
6	Run	Indicate the status of the device.
7	Power	Indicate the status of the power connection

Figure 1-3-2 Rear view of DWG2000D-32G

1.4 Functions and Features

1.4.1 Protocol Standard Supported

- Standard SIP and MGCP(option) protocol;
- Simple Traversal of UDP over NATs (STUN);
- Point-to-point protocol over Ethernet (PPPoE);
- Hypertext Transfer Protocol (HTTP);
- Dynamic Host Configuration Protocol (DHCP);
- Domain Name System (DNS);
- ITU-T G.711α-Law/μ-Law、G.723.1、G.729AB;
- VLAN and VPN

1.4.2 System Function

- PLC: Packet loss concealment
- VAD: Voice activity detection
- CNG: Comfort Noise Generation
- Local/Remote SIM card work mode
- Adjustable gain of port
- DTMF adjustment
- Balance alarm
- Lock/unlock SIM/UIM
- Mobile number display rejection
- Sending/receiving SMS
- Customize IVR Recording
- White and black list
- One number access
- Open API for SMS, support USSD
- Echo Cancellation (with ITU-T G.168/165 standard)
- Automatic negotiate network
- Hotline
- BCCH

1.4.3 Industrial Standards Supported

- Stationary use environment: EN 300 019: Class 3.1
- Storage environment: EN 300 019: Class 1.2
- Transportation environment: EN 300 019: Class 2.3
- Acoustic noise: EN 300 753
- CE EMC directive 2004/108/EC
- EN55022: 2006+A1:2007
- EN61000-3-2: 2006,
- EN61000-3-3: 1995+A1: 2001+A2: 2005
- EN55024: 1998+A1: 2001+A2: 2003
- Certifications: FCC, CE

1.4.4 General Hardware Specification

- Power Supply: 220VAC
- Temperature: 0~40 °C (Operation) , -20~80 °C (storage)
- Humidity: 5%~90%RH
- Power Consumption: 80W
- Dimensions: 440(W) x330 (D) x66 (H) mm
- Net weight: 6.4 kg

2. Equipment Quickly Installation

This chapter mainly introduces DWG2000D-32G hardware installation and connection of equipment.

2.1 Installation Notice

DWG2000D-32G provides standard RJ45 with 10Mbps or 100Mbps interfaces.

For Wireless part, make sure antennas connecting well on device. Inserting SIM cards and GSM channels should work properly.

2.2 Installation Procedure

2.2.1 Install SIM Card

When installing SIM card, loosen the screws on the front panel of device. Procedure shows as below:

- Loosen screw, draw out the user board
- Inset the SIM card to the SIM slot of the back of the user board
- The user board inserted into the device
- Tighten the screws

Figure 2-2-1 SIM card Installation (1)

Figure 2-2-2 SIM card Installation (2)

3. Network Configuration

In this chapter we will introduce the initial configuration of DWG2000D-32G. All of the network parameters of the gateway can be configured by IVR guidance.

3.1 Attentions

In each step, if user hears an IVR message of “setting successful”, which means that user has finished this step successfully. However, if user hears a “setting failed” message, please re-do that step again.

3.2 General Feature Codes for System Setting

Table 3-3-1 Feature codes for system setting

Feature codes	Description
*114#	Play SIP user ID
*150*a#	Set IP address(static/DHCP), a can be digit 1 or 2,*150*1# is static IP address
*152*a*b*c*d#	Configure IP address, a, b, c, d are the four fields of IP address.
*153*a*b*c*d#	Configure subnet mask. a, b, c, d are the four fields of the subnet mask
*156*a*b*c*d#	Configure the device gateway, a, b, c, d are the four fields of the device gateway
*158#	Report LAN port IP address
*159#	Report WAN port IP address
*157	Setting the work mode (route or bridge), * 157 * 0 # is route mode, * 157 * 1 # is bridge mode

*195#	Play record
*198#	Clear record
*199#	Setting Record. dial*199# start record(≤ 20s), then press # end the recording
*111#	Restart device

3.3 Static IP Configuration

This is an optional configuration step. In case of user forgot the IP address or the device can't obtain IP address from local network properly, IVR guideline may help to fix it.

Assume that DWG2000D-32G IP address to be 172.16.80.89, subnet mask is 255.255.0.0, default gateway is 172.16.1.1, configure it through IVR as following steps:

- 1) Please make sure SIM card installed well and registered
- 2) Dial the phone number of the SIM card. Press "*150*1#" after heard "dial the extension number ".
Hang up after heard "setting successful" prompt.
- 3) Dial the phone number of the SIM card. Dial "* 152 * 172 * 16 * 80 * 89 #" after heard "dial the extension number ". Hang up after heard "setting successful".
- 4) Dial the phone number of the SIM card. Dial "*153*255*255*0*0#" after heard "dial the extension number ". Hang up after heard "setting successful"
- 5) Dial the phone number of the SIM card. Dial "*156*172*16*1*1#" after heard "dial extension number ". Hang up after heard "setting successful"
- 6) Dial the phone number of the SIM card. Dial "*111#" after heard "dial extension number ", that will restart the device
- 7) Dial the phone number of the SIM card. Dial "*158#" after heard "dial extension number ". It will play report the IP address of LAN port.

3.4 DHCP Configuration

DHCP mode configure as follows:

- 1) Please make sure hardware installation have finished
- 2) Dial the phone number of the SIM card. Dial "*150*2#" after heard "dial extension number ". That means the DHCP is configured successfully
- 3) Restart the device, wait for 30 seconds, and then dial the SIM card telephone number, enter "*158 #" to query the IP address

Note: If reporting the IP address is 0.0.0.0, which means that the gateway could not obtain a IP address successfully. Please check:

- 1) Make sure the device have been connected to the network
- 2) Make sure the DHCP Server is working. If there is no DHCP Server, please set the IP of device to static IP
- 3) Restart the gateway and try again

4. WEB Configuration

This chapter describes web configuration of DWG2000D-32G.

4.1 Access the System through HTTP

The default IP of LAN port is 192.168.11.1, before web access, make sure the PC is able to ping continuously.

Here the device's IP address is 172.16.80.89, after input this IP, the GUI shows as below:

Figure 4-1-1 WEB log interface

Enter username and password and then click "OK" in configuration interface. The default username and password are "admin/admin". We are strongly recommend to change the default password for security purpose.

4.2 WEB Configuration

DWG2000D-32G WEB configuration interface consists of the navigation tree and the detail configuration interfaces.

Figure 4-2-1 WEB introduce

Run Information

31	GSM	460002171979652	Mobile Registered	No Limit	CHINA MOBILE		0	0	0	0

Table 4-3-2 Description of mobile information

Port	GSM channel number, it is range from 0 to 31
Type	Indicates the current type of network. Such as CDMA or GSM
IMSI	International Mobile Subscriber Identity, it is the uniquely identifies of SIM card
Status	Indicates the register status of current GSM module
Remaining Call Duration	Limited call duration of SIM card, when call duration is out of that duration, the call would be disconnected. This option shows remaining talk time.
Carrier	Displays the network carrier of current SIM card.
Signal Quality	Displays the signal strength of in each channels of GSM
BER	Bit error rate, internal parameter
ASR	Answer Seizure Ratio is a measure of network quality. Its calculated by taking the number of successfully answered calls and dividing by the total number of calls attempted. Since busy signals and other rejections by the called number count as call failures, the ASR value can vary depending on user behavior.
ACD	The Average Call Duration (ACD) is calculated by taking the sum of billable seconds (billable) of answered calls and dividing it by the number of these answered calls.

PDD	Post Dial Delay (PDD) is experienced by the originating customer as the time from the sending of the final dialled digit to the point at which they hear ring tone or other in-band information. Where the originating network is required to play an announcement before completing the call then this definition of PDD excludes the duration of such announcements.
Call Status	Show the status of call, its include 3 type of status : Idle: the GSM channel is free. It is ready to receive the call Processing: the call is delivering to mobile network Active: the call is established

4.3.3 SIP Information

Figure 4-3-3 SIP information

SIP Information							
Port	SIP User ID	Register Status	Status	Port	SIP User ID	Register Status	Status

Secondary DNS Server

Table 4-5-2 Description of VLAN Parameter

Data VLAN	Data 802.1Q VLAN ID	Under standard VLAN protocol set VLAN ID. "0" is used to management VLAN, and can't be used to service configure.
	Data 802.1p Priority (0-7)	Under 802.1q protocol users can set VLAN priority
Voice VLAN	Voice 802.1Q VLAN ID	Under standard VLAN protocol set VLAN ID
	Voice 802.1p Priority (0-7)	Under 802.1q protocol users can set VLAN priority
	IP address	Users can set DHCP or static IP address
	Voice VLAN DNS Server	Users can set DHCP or static DNS server IP address
Management VLAN	Management 802.1Q VLAN ID	Under standard VLAN protocol set VLAN ID. "0" is used to management VLAN, and can't be used to service configure.
	Management 802.1p Priority (0-7)	Under 802.1p protocol users can set VLAN priority
	IP address	Users can set DHCP or static IP address
	Management VLAN DNS Server	Users can set DHCP or static DNS server IP address

4.5.3 ARP

The ARP function mainly used to query and add the map of IP and MAC. There are static or dynamic ARP entries.

Like other routers, the gateway can automatically find the network device on the same segment. But, sometimes you don't want to use this automatic mapping; you'd rather have fixed (static) associations between an IP address and a MAC address. Gateway provides you the ability to add static ARP entries to:

- Protect your network against ARP spoofing
- Prevent network confusion as a result of misconfigured network device

Figure 4-5-4 Add ARP

Add ARP

IP Address	<input type="text"/>
MAC Address	<input type="text"/>

The IP format is: xxx.xxx.xxx.xxx
The MAC format is: xx-xx-xx-xx-xx-xx

4.6.1 Basic Configuration

Figure 4-6-2Basic Configuration

Basic Configuration

Dial Tone Gain (Mobile Side)	8 dB
Select Band	Default(Automatic)
Forward Enable	<input type="radio"/> No <input checked="" type="radio"/> Yes
Forward Master Mobile	Port 0
Remote API Enable	<input type="radio"/> No <input checked="" type="radio"/> Yes
API Server Address	0.0.0.0
API Server Port	0
API User ID	
API User Password	***** Show Password
Auto Reset Module	<input type="radio"/> No <input checked="" type="radio"/> Yes
Counts of NO CARRIER to reset	5
Counts of NO DIALTONE to reset	3

NOTE: Option 'Reject Incoming' will be disabled, When 'yes' is checked on option 'Forward Enable'.

Save

Table 4-6-1 Description of Basic Configuration

Dial Tone Gain	It is the dial tone volume of call waiting, dial tone of mobile module when call out. default value is 8 dB.
Select Band	According to carrier's band standards. Standards are as belows: GSM: 850/900/1800/1900 MHz; CDMA: 800 MHz
Remote API Enable	API is mainly for third party software which developed based-on Dinstar API protocol. Its help to provide bulk SMS/ SMS/USSD over IP service.
API Server Address	It is the remote IP address who uses API. This is an option when selecting "Yes" under 'remote API enable'
API Server Port	It is the port number of IP transmission. This is an option when selecting "Yes" under "remote API enable". The port cannot conflict with the other application software. The default value is 12000
Auto Reset Module	Reset modular by automatically while some special errors happened, such as No Carrier, No Dial tone
Counts of No CARRIER to reset	A kind of the error, continuously N times will reboot the modular. N is range from 3 to 255.
Counts of No DIAL TONE to reset	A kind of the error, continuously N times will reboot the modular. N is range from 3 to 255.

Mobile Configuration

Select Port	<input type="button" value="Port 0"/>
Mobile Number	<input type="text"/>
Enable Call Duration Limitation of single call	<input checked="" type="radio"/> No <input type="radio"/> Yes
Enable Call Duration Limitation	<input checked="" type="radio"/> No <input type="radio"/> Yes
CLIR	<input checked="" type="radio"/> No <input type="radio"/> Yes
Mobile Tx Gain	3 dB
Mobile Rx Gain	4 dB
<input type="button" value="Reset Module"/>	

NOTE: 1.If the duration of a call is less than 'Minimum Charging Time', it will be not included in 'Call Duration'.
2.Check the anti-pole signal is only effective on the CDMA.
3.Please enable NTP if you want to auto reset Total Call Time.

Table 4-6-2 Description of Mobile Configuration

Mobile Number	Phone number of current SIM card
Enable Call Duration Limitation of single call	Definite maximum call duration for single call. Example: if Time of single call set to 10, the call will be disconnected after talking 10*step seconds
Step	Step length value range is 1-120 s, step length multiplied by time of single call just said a single call duration time allowed.
Time of single call	The value of limitation single call, this value range is 1-65535. step length multiplied by time of single call just said a single call duration time allowed.
Enable Call Duration Limitation	This function is to limit the total call duration of GSM channel. The max call duration is between 1 to 65535 minutes.
Auto Reset	Automatic restore remaining talk time, that is, get total call minutes of GSM channel
Reset Period	Reset call minutes by date, by week, by month
Next Reset time	Defined next reset date, system will count start from that date and work as Reset Period setting
Minimum Charging Time	A single call over this time, GSM side of the operators began to collect fees, unit for seconds.
Alarm Threshold(via SMS)	Define a threshold value of call minutes, while the call minutes less than this value, the gateway will send alarm information to designated phone

	number via SMS.
Mobile Number (Receiving Alarm)	Receiving alarm phone number, user will receive alarm message from gateway.
Port Description for Alarm	Alarm port information description, which will be sent to user mobile phone with alarm information.
SIM Remain Time	This value is multiplied by step length is a rest call time
Restore Time	Restore the rest of the SIM card talk time to the maximum call duration
CLIR	Caller ID restriction, this function is used to hide caller ID of SIM card number. The gateway will add "#31#" in front of mobile number. This function must support by Operator.
Mobile Tx Gain	Control IP to GSM side of call the gain. Default is +6 dB.
Mobile Rx Gain	Control GSM to IP side of call the gain. Default is +6 dB.

4.6.3 PIN Management

Figure 4-6-4 PIN Management

The screenshot shows a web-based configuration interface for PIN Management. At the top, a blue header bar reads "PIN Management". Below it, there are three main configuration sections:

- Select Port:** A dropdown menu currently set to "Port 0".
- SIM Card Lock:** Two radio buttons labeled "No" and "Yes", with "No" being the selected option. Below this is a text input field for the PIN code.
- Save:** A blue rectangular button located at the bottom right of the form area.

Detailed description as below:

Table 4-6-4 Description of PIN Management

Select Port	Selects the GSM channel No.
SIM Card Lock	Whether to allow lock the SIM card
PIN Code	Personal identification number of SIM card. In the status of SIM card locked, PIN can be modified to prevent SIM card from being stolen.

4.6.4 SMSC

Figure 4-6-5 SMSC

The screenshot shows a web-based configuration interface for the SMSC. At the top, it says "SMSC". Below that, there are two input fields: "Select Port" with a dropdown menu set to "Port 0" and "SMSC" with a text input field containing "+8613800755500". At the bottom right is a blue "Save" button.

SMS center of mobile, in most places, the cellular modular will automatically detect the SMSC number. This configurable option is used in a situation that the SMSC number could not be detected by cellular modular. When such case happens, please contact with mobile service provider to identify the SMSC number and then add SMSC number in SMSC configurable web interface.

4.6.5 SMS

Figure 4-6-6 SMS Message

The screenshot shows a "Send Message" interface. It includes fields for "Select Port" (set to "Random Port"), "Encoding" (set to "UCS2"), "To" (mobile number "+8613800755500"), and a large "Message" input area. Below the message area, a red note says "NOTE: Length of 'Message' should be not more than 300 characters." At the bottom right is a blue "Send" button.

Table 4-6-5 Description of SMS sending

Select Port	Users can select a defined channel or random channel to send SMS. Input the receiver's mobile phone number to send SMS.
Encoding	Two kinds of message encoding under PDU models, 7-bit code used to sent ordinary ASCII characters; UCS2 coding used to sent Unicode characters.
To	Mobile phone No. of the receiver
Message	Content of the SMS. The length is limited to 300 characters.

4.6.6 USSD

USSD (Unstructured Supplementary Service Data) is a Global System for Mobile(GSM) communication technology that is used to send text between a mobile phone and an application program in the network. Applications may include prepaid roaming or mobile chatting. USSD can cluster and group of charge

NOTE: 0 routing is not allowed to delete, only allowed to change.

Table 4-7-3 Description of Tel to IP Routing

Tel -> IP Routing	This item uses to configure incoming call routes which can be used for receive the calls from the GSM.
Index	It uniquely identifies a route. Its value is assigned globally, ranging from 0 to 31. The route preferentially match the rules which the value of index is smaller
Description	It describes the route for the ease of identification. Its value is character string
Source Port	It specifies the Port or Port Group which will receive the calls from PLMN
Source Prefix	All the caller number must match the source prefix. It specifies the source prefix allow to send call out <ul style="list-style-type: none"> • Any: include anonymous, 0xxxx, 1[2-9]xxxx etc. • 0xxxx: consist of some digits such as 015,08,09 • 1[3-8]6:consist of some prefix, include 136,146,156,166,176, 186
Destination Prefix	All the called number must match the destination prefix, the call prefix indicates the connected number <ul style="list-style-type: none"> • Any: include anonymous, 0xxxx, 1[2-9]xxxx etc. • 0xxxx: consist of some digits such as 015,08,09 • 1[3-8]6:consist of some prefix, include 136,146,156,166,176, 186
Destination	Its specifies destination Port or Port Group

Figure 4-7-4 Tel to IP routing Modify

Tel->IP Routing Modify

Index	0	
Description	default	
Source Prefix	any	
Source	<input checked="" type="radio"/> Port 0 <input type="radio"/> Port Group 0 <all>	
Destination Prefix	any	
Destination	<input type="radio"/> Port 0 <input type="radio"/> Port Group 0 <all> <input type="radio"/> IP 10 <other> <input type="radio"/> IP Group 18 <asterisk> <input checked="" type="radio"/> SIP Server	
<input type="button" value="OK"/> <input type="button" value="Reset"/> <input type="button" value="Cancel"/>		

It's a default route configured in gateway. It allows any number from source port 0 send call to SIP server with any prefix.

Figure 4-7-5 Tel to IP routing Modify

Tel->IP Routing Modify

Index	30	
Description	To vps	
Source Prefix	x.	
Source	<input type="radio"/> Port 0 <input checked="" type="radio"/> Port Group 31 <Unicom>	
Destination Prefix	00	
Destination	<input type="radio"/> Port 0 <input type="radio"/> Port Group 0 <all> <input checked="" type="radio"/> IP 13 <eia> <input type="radio"/> IP Group 18 <asterisk> <input type="radio"/> SIP Server	
<input type="button" value="OK"/> <input type="button" value="Reset"/> <input type="button" value="Cancel"/>		

Add a GSM to VoIP route. It indicates that the calls coming from Port Group 31<Unicom> will match the prefix "x.", "x." is a wildcard string which will match any prefix except "anonymous" calls. Meanwhile sending the calls destination IP 13<eia> if called number match with destination prefix "00".

Figure 4-7-6 Tel to IP routing Modify

Add GSM to GSM route, its mainly used for saving the cost between two carriers. It indicates that calls coming from Port 0 will match the prefix 13[58], "13[58]" include prefix 135 and 138, caller number can't match prefix 135 and 138 will reject by gateway. Meanwhile sending the calls to Port Group 31<Unicom> if called number match with prefix 133.

4.8 Manipulation Configuration

4.8.1 IP->Tel Destination Numbers

Figure 4-8-1 IP->Tel destination numbers manipulation

IP->Tel Destination Numbers										
Index	Description	Source	Source Prefix	Destination Prefix	Destination	Stripped Digits from Left	Stripped Digits from Right	Prefix to Add	Suffix to Add	Number of Digits to Leave from Right
--	--	--	--	--	--	--	--	--	--	--

Total: 0 entry 16entry/page 1/0page

Table 4-8-1 Description of IP->Tel destination numbers manipulation

IP->Tel destination numbers manipulation	It is an optional configuration item, and is used to add a rule for changing number
Index	It uniquely identifies a route. Its value is assigned globally, ranging from 0 to 31. The route preferentially match the rules which the value of index is smaller
Description	It describes the rule for the ease of identification. Its value is character string
Source	It specifies the source IP which will send the calls to gateway

	<ul style="list-style-type: none"> • Any: any IP address • IP: specific an IP address • IP Group: specific an IP group
Source Prefix	<p>All the caller number must match the source prefix. It specifies the source prefix allow to send call out</p> <ul style="list-style-type: none"> • Any: include anonymous, 0xxxx, 1[2-9]xxxx etc. • 0xxxx: consist of some digits such as 015,08,09 • 1[3-8]6:consist of some prefix, include 136,146,156,166,176, 186
Destination Prefix	<p>All the called number must match the destination prefix, the call prefix indicates the connected number</p> <ul style="list-style-type: none"> • Any: include anonymous, 0xxxx, 1[2-9]xxxx etc. • 0xxxx: consist of some digits such as 015,08,09 • 1[3-8]6:consist of some prefix, include 136,146,156,166,176, 186
Destination	Its specifies destination Port or Port Group
Stripped Digits from Left	It specifies the length of the digits to be deleted from left
Stripped Digits from Right	It specifies the length of the digits to be deleted from right
Prefix to Add	Add the new digits in front of the original number
Suffix to Add	Add the new digits at the end of the original number
Number of Digits to leave from right	It specifies the length of the digits to be deleted from left

Add an IP->Tel Manipulation, to change the called number from 2547888888 to 07888888

Figure 4-8-2 IP->Tel destination numbers manipulation modify

IP->Tel Manipulation Modify

Index	0
Description	safcom
Source Prefix	any
Source IP	<input type="radio"/> IP 13 <mathnew> <input checked="" type="radio"/> IP Group 31 <allow calls>
Destination Prefix	2547
Destination Port	<input type="radio"/> Port 0 <input checked="" type="radio"/> Port Group 31 <1>
Stripped Digits from Left	3
Stripped Digits from Right	
Prefix to Add	0
Suffix to Add	

NOTE: If you need route calls after manipulation, set the destination port chosen arbitrarily.

OK **Reset** **Cancel**

It indicates that calls coming from IP Group will match the prefix "any", and the called number which match with the prefix "2547" will delete 3 digits in front of it and replace it by digit "0".

4.11 IP Trunk Configuration

4.11.1 IP Trunk

Figure 4-11-1 IP Trunk

The screenshot shows a table titled "IP Trunk" with five columns: Index, IP, Port, Description, and KeepAlive Enable. All columns have a value of "--". Below the table is a message "Total: 0 entry 16entry/page 1/0page" with a dropdown arrow. At the bottom are three buttons: "Add", "Delete", and "Modify".

IP Trunk				
Index	IP	Port	Description	KeepAlive Enable
--	--	--	--	--

Total: 0 entry 16entry/page 1/0page

Table 4-11-1 Description of IP Trunk

IP Trunk	Add remote IP of softswitch, SIP server which will send call traffics to gateway.
Index	It uniquely identifies a trunk, ranging from 0 to 31.
IP	It is an interworking parameter between the remote Softswitch and the SIP server. It specifies the IP address of the peer equipment.
Port	It is an interworking parameter between the remote Softswitch and the SIP server. It specifies the SIP port number of the peer equipment
Description	It describes the trunk for the ease of identification. Its value is character string
KeepAlive Enable	It is use to detect connection between GSM gateway and remote IP trunk

Example

To add a remote IP of Softswitch, set "index" to "31", SIP port number "5060"

Figure 4-11-2 IP Trunk Modify

The screenshot shows a form titled "IP Trunk Add" with five input fields: Index (set to 31), IP, Port, Description, and KeepAlive Enable (unchecked). At the bottom are three buttons: "OK", "Reset", and "Cancel".

IP Trunk Add

4.12 System Configuration

4.12.1 Service Configuration

Service Configuration is used for configuring voice calls and some small businesses, such as Call Progress Tone, codec, silence suppression, * service, the second dial and so on

Figure 4-12-1 Service Configuration

The screenshot shows the 'Service Configuration' window with the following settings:

- Local Start RTP Port:** 8000
- Enable Silence Suppression:** Yes (radio button selected)
- Call Progress Tone:** USA
- Preferred Coders (in listed order):**
 - 1st: G.729AB
 - 2nd: PCMU
 - 3rd: PCMA
 - 4th: G.723.1
- Voice Frames per Tx:** 2
- Do Not Answer GSM Incoming Call for Hotline:** No
- Enable GSM Incoming Configuration:** Yes
- Auto Outgoing Routing Type:** Polling
- IP to GSM One Stage Dialing:** No
- Redirect Call When All Ports Busy:** Yes
- Play Voice Prompt for GSM Incoming Calls:** Yes
- DTMF Parameter:**
 - DTMF Method: SIGNAL
 - DTMF Volume: 0dB
 - DTMF Interval: 200 ms
- NAT Traversal:** Disable
- Other Configuration:**
 - Enable Private Service: Yes
 - User ID is Phone Number: Yes
 - Only Accept Calls from SIP Server: Yes
 - Allow Call from GSM to IP without Registration: Yes
 - Allow Call from IP to GSM without Registration: Yes
 - Reject Anonymous Call from IP to GSM: Yes
 - Use # as End Key: Yes
 - No Answer Timeout: 55 s
 - Intergit Timeout: 4 s
 - Call Delay: 0 s

Table 4-12-1 Description of Service Configuration

LOCAL Start RTP PORT	Means the initial port when RTP voice stream transmit in the IP network , in general, using the factory default values. When there are multiple DINSTAR series voice products, and the network gateway or router's NAT with loopholes, user can try changing this item
Enable Silence Suppression	Enable the "silence suppression" almost no impact on call quality, and can save about half of the bandwidth.
Call Progress Tone	Each country has its different call progress tone required standards, such as busy tone, ring back tones and ring tone.
Preferred Coders	Means the code format when Voice transfer on IP network, support PCMA, PCMU, G.723.1 andG.729AB.
Enable PSTN Incoming Configuration	Means when call from PSTN side, you can dial the function keys for checking number, setting IP and so on
Enable Auto Outgoing	Means when call out , whether by ordinal or polling pick to Select a Channel,

Routing	this feature are generally used when use the same SIP User ID to register
IP to PSTN One Stage Dialing	The User ID will be sent directly to PSTN, for example: the user calls 6715, the device will send 6715 User ID to PSTN
Play Voice Prompt for PSTN Incoming Calls	Setting is yes, when through the PSTN calls to the Channel, the device will with the clew tone, the default is "Please dial the extension User ID"; setting to No, the device will play dial tone
DTMF	DWG2001/DWG2004/DWG2000D-32G support RFC2833 and SIGNAL two ways. DTMF INTERVAL range is 50 ~ 800ms, DTMF VOLUME can use the default Configuration
Nat Traversal	Include Static NAT and STUN, NAT's UDP simple cross
STUN	STUN (Simple Traversal of UDP over NATs) is a network protocol. It is allowed to stay behind the NAT (or multiple NAT) client part to identify their clients' public address, found himself after what Type of NAT and NAT for a particular Channel is bound to a local Internet terminal Channel. This information is used for two host to set up UDP communication behind the same NAT router. The agreement defined by the RFC 3489
Allow call from IP to PSTN without Registration	Refer to "SIP Configuration" -> "Is register" . If "Is register" setting is no, this option need set Yes ,to avoid that the devices can not call out
Allow Call from PSTN to IP without Registration	Refer to "SIP Configuration" -> "Is register" . If "Is register" setting is no, this option need set Yes ,to avoid that the devices can not call in
Reject Anonymous call from IP to PSTN	The incoming anonymous calls will be rejected
Use # as End Key	In General, SIP phones are based on # as the end, if this option is set to No, the dial-up will end expires dial-up time
Interdigit Timeout	Bit of between the dialing time ,over the time will be seem as end of dial

4.12.2 SIP Configuration

Figure 4-12-2 SIP Configuration

The screenshot shows the 'SIP Configuration' interface with the following settings:

- SIP Proxy:**
 - SIP Server Address: 0
 - SIP Server Port (default: 5060): 5060
 - Check Net Status: No
- Outbound Proxy:**
 - Outbound Proxy Address: 5060
 - Outbound Proxy Port: 5060
- Use Random Port:**
 - Local SIP Port: 5060
 - Use Random Port: Yes
- Is Register:**
 - DNS query type: A query
 - DNS refresh interval (range: 0 - 60,000min, 0 means disable): 0 min
 - T1: 500 ms
 - T2: 4000 ms
 - T4: 5000 ms
 - TMAX: 32000 ms
 - Keepalive Interval (range: 1 - 3600s): 10 s
 - Enable 100rel: Yes
 - From Mode when Caller ID Is Available: Tel/User
 - From Mode when Caller ID Is Unavailable: Anonymous
 - Answer Mode: Answered
 - 183 Mode: Immediately
- Response Code switch:**
 - Response code: [Empty box]
 - Response code after switch: [Empty box]

Table 4-12-2 SIP Configuration

SIP Server Address	Used for configure SIP server address and port, the address can be IP Address, also can be a domain name which can be resolved by DNS server
SIP Proxy Port	Port default setting is 5060. For details, please consult the service provider
Outbound Proxy	Outbound proxy, it mainly used in firewall / NAT environment. That make the signaling and media streams are able to penetrate the firewall
Use Random Port	Set the local monitor SIP port (fixed or random), random is every time you start the device will random Select a free SIP port For listening
Is Register	Default set yes, if you want the device can make a call without register, set No, Also enable the "Allow Call from IP to PSTN without Registration" and "Allow Call from PSTN to IP without Registration" function
Register Interval	Means how often the equipment will register to the SIP server/proxy
DNS query type	The DNS query type defines the type of information that will be requested from DNS server
DNS refresh interval	The interval of DNS refresh, Range from 0 to 60000 mins, 0 means disable default value is disable.

T1	Used to define the SIP protocol T1 timer value, default is 500ms
T2	Used to defines the SIP protocol timer values, default value is 4000ms
T3	Used to define the T2 timer value in SIP protocol, the default is 5000ms
Keep alive Interval	Used to keep communicate between equipment and the SIP server that make the device is available . In general, using the factory default values
From Mode when Caller ID Is Available	<p>Used to config "From" Mode when Caller ID Is Available when call from GSM to VoIP</p> <p>Tel/User: From: caller number <sip:3001@IP>;tag=51088abb</p> <p>User/User: From: 3001 <sip:3001@IP>;tag=51088abb</p> <p>Tel/Tel: From: caller number <sip: caller number @IP>;tag=51088abb</p> <p>User/Tel: From: 3001 <sip: caller number @IP>;tag=51088abb</p>
From Mode when Caller ID Is Unavailable	<p>Used to config "From" Mode when Caller ID Is Unavailable</p> <p>Anonymous : From: <sip: Anonymous @IP>;tag=51088abb</p> <p>Username : From: <sip: Username @IP>;tag=51088abb</p>
Answer Mode	<p>Answered: Gateway answer the IP incoming call (send SIP message "200 OK" to IP part) after GSM part answered</p> <p>Alerted: Gateway answer the IP incoming call after GSM part Alerted</p>
183 Mode	<p>Immediately: Gateway send "183 RING" immediately to IP part while it receive "INVITE" from IP part.</p> <p>Alerted: Gateway send "183 RING" after receive "ring back" from PSTN</p>
Response Code switch	Used to configure the compatibility of SIP Response Code , Fill the response code in the front , and Fill the switch code in the behind

4.12.3 Port Parameter

Figure 4-12-3 Port Parameter

The screenshot shows the 'Port Configuration' screen. At the top, there is a table titled 'Port List' with columns: Port, SIP User ID, Authenticate ID, Tx Gain, Rx Gain, To VOIP Hotline, To PSTN Hotline, Auto-Dial Delay Time(s), and Detail. One row is shown with Port 0, SIP User ID 1223, Tx Gain -2, Rx Gain 2, Auto-Dial Delay Time(s) 3, and a 'Detail' button.

The main area is titled 'Port Configuration'. It contains the following fields:

- All ports register used same user ID:** A radio button group with 'No' (unchecked) and 'Yes' (checked).
- Current Port:** A dropdown menu set to 'Port 0'.
- SIP User ID:** An input field containing '1223'.
- Authenticate ID:** An empty input field.
- Authenticate Password:** An empty input field.
- Tx Gain:** A dropdown menu set to '-2dB'.
- Rx Gain:** A dropdown menu set to '+2dB'.
- To VOIP Hotline:** An empty input field.
- To PSTN Hotline:** An empty input field.

At the bottom are two buttons: 'Save' and 'Back'.

Table 4-12-3 Description of Port Configuration

Port Configuration	Used to configure ports' gain, Auto-Dial, etc.
ALL ports register used same user ID	The default is not. If set to "yes" ,all the port will use user ID
SIP User ID	It is the account used for registration, equipment port's unique identifier
Authenticate ID	Used for authenticate
Password	Its register Password
Tx Gain	Its DSP's Tx Gain. Adjusting it will effect volume on GSM side.
Rx Gain	Its DSP's Tx Gain. Adjusting it will effect volume on IP side.
To VoIP Hotline	When PSTN part client calls to this port, gateway will auto forward to the hotline User ID. Leave it blank if you don't need this function. *Note: Please config Tel->IP Operation if you need this function.
To PSTN Hotline	When VoIP part client calls to this port, Gateway will auto forward to the number to PSTN part. Leave it blank if you don't need this function. *Note: Please config IP->Tel Operation if you need this function.

4.13 Digit Map

Figure 4-13-1 Digit map

Digit Map Syntax:

1. Supported objects

Digit: A digit from "0" to "9".

Timer: The symbol "T" matching a timer expiry.

DTMF: A digit, a timer, or one of the symbols "A", "B", "C", "D", "#", or "*".

2. Range []

One or more DTMF symbols enclosed between square brackets ("[" and "]"), but only one can be selected.

3. Range ()

One or more expressions enclosed between round brackets "(" and ")"), but only one can be selected.

4. Separator

|: Separated expressions or DTMF symbols.

5. Subrange

-: Two digits separated by hyphen ("") which matches any digit between and including the two. The subrange construct can only be used inside a range construct, i.e., between "[" and "]".

6. Wildcard

x: matches any digit ("0" to "9").

7. Modifiers

.: Match 0 or more times.

8. Modifiers

+: Match 1 or more times.

9. Modifiers

? : Match 0 or 1 times.

Example:

Assume we have the following digit maps:

1. xxxxxxx | x11

and a current dial string of "41". Given the input "1" the current dial

string becomes "411". We have a partial match with "xxxxxx", but a complete match with "x11", and hence we send "411" to the Call Agent.

2. [2-8] xxxxxx | 13xxxxxxxx

Means that first is "2", "3", "4", "5", "6", "7" or "8", followed by 6 digits; or first is 13, followed by 9 digits.

3. (13 | 15 | 18)xxxxxxxx

Means that first is "13", "15" or "18", followed by 8 digits.

4. [1-357-9]xx

Means that first is "1", "2", "3" or "5" or "7", "8", "9", followed by 2 digits.

4.14 Tools

4.14.1 Firmware Upload

Figure 4-14-1 Firmware upload

Firmware Upload		
Send "Idf" file from your computer to the device.		
Software	<input type="button" value="Browse..."/>	<input type="button" value="Upload"/>
Web	<input type="button" value="Browse..."/>	<input type="button" value="Upload"/>
Dsp Firmware	<input type="button" value="Browse..."/>	<input type="button" value="Upload"/>

NOTE: 1. After uploading, please restart the device to take effect.
2. Please wait 60 seconds after Dsp Firmware upload is successful.

Select the software, Web or DSP firmware program under correct directory services, and then click upload will complete upgrade the firmware. During the upgrade process, please do not switch off the power supply, equipment may paralyze.

4.14.2 Management Parameter

Figure 4-14-2 Management Parameter

Management Parameter	
Voice Prompt Language	<input type="button" value="English"/>
Syslog Parameter	<input checked="" type="radio"/> Yes <input type="radio"/> No
Syslog Enable	<input checked="" type="radio"/> Yes <input type="radio"/> No
NTP Parameter	<input checked="" type="radio"/> Yes <input type="radio"/> No
NTP Enable	<input type="button" value="us.pool.ntp.org"/>
Primary NTP Server Address	<input type="button" value="123"/>
Primary NTP Server Port	<input type="button" value="123"/>
Secondary NTP Server Address	<input type="button" value="18.145.0.30"/>
Secondary NTP Server Port	<input type="button" value="123"/>
Check Interval	<input type="button" value="3600"/>
Time Zone	<input type="button" value="s"/>
	<input type="button" value="GMT-6:00 (US Central Time, Chicago)"/>

Table 4-14-1 Management Parameter

Voice Prompt Language	Select the language of voice prompt. There are two kind of voice : English and Chinese
Syslog Paremeter	Syslog is a standard for network device data logging. It allows separation of the software that generates messages from the system that stores them and the software that reports and analyzes them. It also provides devices which would otherwise be unable to communicate a means to notify administrators of problems or performance. There are 5 grades of syslog, Including NONE, DEBUG, NOTICE, WARNING and ERROR.
NTP Parameter	The Network Time Protocol (NTP) is a protocol and software implementation for synchronizing the clocks of computer systems over packet-switched, variable-latency data networks. User need to fill the NTP Server Address and select Time Zone

4.14.3 Config Backup

Figure 4-14-3 Config backup

Click 'Backup' for download configuration file to your computer.

4.14.4 Data Restore

Figure 4-14-4 Data restore

Send data file from your computer to the device

4.14.5 IVR Voice Prompt Upload

By default, when PSTN call incoming, the system will play the default IVR, and also the user can load custom IVR.

Figure 4-14-5 IVR Voice Prompt Upload

NOTE: 1. "wav" file should be not more than 360k bytes.
2. It must restart the device to take effect.

NOTE: the customize voice files can be recorded using Windows recording programs, the sound format is 8000Hz, 16 bit sampling in mono, with WAV format, size of files can not exceed 190KB.

4.14.6 PING test

Ping is utility used to test the reachability of a host on an Internet Protocol (IP) network and to measure the round-trip time for messages sent from the originating host to a destination host.

Figure 4-14-6 Ping Test

4.14.7 Tracert Test

Trace route is a computer network diagnostic tool for displaying the route (path) and measuring transit delays of packets across an Internet Protocol (IP) network.

Figure 4-14-7 Tracert Test

The screenshot shows a 'Tracert Test' configuration window. It has two input fields: 'Tracert Destination' set to 'www.google.com.hk' and 'Max Hops of Tracert(1-255)' set to '30'. Below these are 'Start' and 'Stop' buttons. The main area is titled 'Information' and displays the traceroute results:

```

Tracing route to www.google.com.hk[74.125.71.99] over a maximum of 30
hops:
 1      1 ms   172.16.1.1
 2      *       Request timed out.
 3      *       Request timed out.
 4     30 ms   121.15.179.86
 5     30 ms   119.145.47.46
 6     30 ms   202.97.35.250
 7     40 ms   202.97.60.142
 8     40 ms   202.97.60.22
 9     40 ms   202.97.61.102
10    80 ms   202.97.62.214
11    40 ms   209.85.241.58
12    30 ms   209.85.253.69
13    40 ms   216.239.48.230
14    30 ms   74.125.71.99
Trace complete.

```

4.14.8 Login Password

Figure 4-14-8 IVR Voice Prompt Upload

The screenshot shows a 'Username & Password' configuration window. It contains two sections: 'Web Configuration' and 'Telnet Configuration'. Each section has four fields: Old Web Username ('admin'), Old Web Password (empty), New Web Username (empty), New Web Password (empty), and Confirm Web Password (empty). Similarly, the Telnet section has Old Telnet Username ('admin'), Old Telnet Password (empty), New Telnet Username (empty), New Telnet Password (empty), and Confirm Telnet Password (empty). A 'Save' button is located at the bottom.

When using web or telnet Configuration, please enter default user name and password. User can modify the login name and password.

4.14.9 Factory Reset

Figure 4-14-9 Factory Reset

Be careful do this operation, after restore factory setting, all the parameters will be changed to the factory default.

4.14.10 Restart

Figure 4-14-10 Restart

5. FAQ

5.1 Device has been connected to network physically, but cannot access the gateway

- 1) Make sure the network cable is ok , can through view the device network port indicator light to determine the physical connection is working or not;
- 2) Make sure the connected network devices (router, switch or hub) support 10M/100M adaptive, if not, connect the Equipment directly to PC, landing WEB and in the "local connection" Configuration interface Select the correct Ethernet Work Mode;
- 3) Check the Network Configuration, if the Configuration is incorrect, please re-Configuration. If you are using DHCP mode, check DHCP Server is working properly;
- 4) Check whether there is a LAN device conflict with the exists IP address.

5.2 Equipment can not register

If the Run LED does not flash mean unregistered

- 1) Check the network connection is working (see above section), whether the Configuration is correct;
- 2) Check whether the LAN firewall setting is inappropriate (such whether limit the network communication); If it is, there are two ways to try to resolve;
- 3) Check whether the Local Network to the SIP PROXY platform network environment is relatively poor or not, and if so, please check Local Network or contact the service provider;
- 4) if go through those steps, the device still be in trouble, please contact the equipment provider;

5.3 When calling out, the callee's phone shows wrong caller ID:

- 1) Ask the callee checks whether the device is failure or device battery power is low
- 2) Make sure the callee has been subscribed called User ID display service
- 3) If only part of the caller User ID with this problem, please contact the telecom carrier.

5.4 sudden interruption during a call

- 1) make sure whether is human error caused the problem
- 2) Check the balance.
- 3) Make sure whether the LAN equipment such as gateway or router fails, user can try to restart the gateway or router

5.5 voice single-pass, double-barrier or poor quality

- 1) Make sure the equipment is working properly with grounded power
- 2) Check the device network connection is in working status
- 3) Ask network administrators to open limitation with the equipment's network communications (it is a special equipment, not afraid of virus attacks); (2) try to enable the equipment tunnel (through the WEB for Configuration, Also, please NOTE, open the tunnel will impact voice quality, Please do not enable the tunnel as far as possible, refer WEB Configuration Interface Description section)
- 4) Make sure the LAN equipment is working, user can try to restart the gateway or router to solve the problem
- 5) Check whether there is more than one DINSTAR series products in LAN network: some gateways or routers, processing network packet is vulnerable (for example, to multiple network devices or the same protocol network communication, NAT allocated the same conversion communications Channel). If there is such a case, suggest replacing a router or specify each voice gateway with different LOCAL RTP PORT Channel (refer to the base WEB Configuration interface section)
- 6) Check the equipment network environment for the softswitch platform, monitor the network condition, make sure the network is solid

6. Glossary

GSM: Global System for Mobile Communications

CDMA: Code Division Multiple Access

FMC: Fixed Mobile Convergence

SIP: Session Initiation Protocol

MGCP: Media Gateway Control Protocol

DTMF: Dual Tone Multi Frequency

USSD: Unstructured Supplementary Service Data

PSTN: Public Switched Telephone Network

STUN: Simple Traversal of UDP over NAT

IVR: Interactive Voice Response

IMSI: International Mobile Subscriber Identification Number

IMEI: International Mobile Equipment Identity

DMZ: Demilitarized Zone
